Why version control?

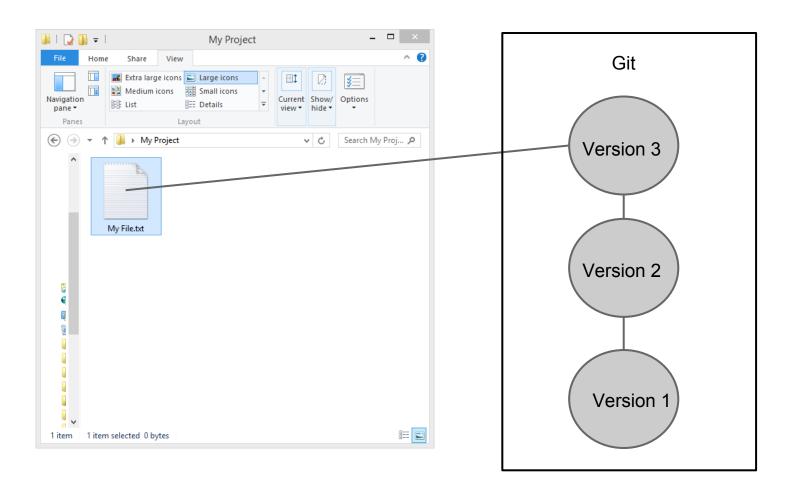

Image credits: Atlassian Git Tutorials More info: https://www.atlassian.com/git/workflows

Why Git?

Small and fast

Takes files snapshots. Almost no network latency

Collaborative

Allows multiple machines working on the same repository

Distributed

No need to have a single server containing all the versioned files.

How to install

http://git-scm.com/downloads/

Basic shell commands

Move between folders: cd, ls, pwd
Create and remove folders: mkdir, rm [-rf]

Setting up Git

git config --global user.name "Aitor Menta" git config --global user.email "menta@uma.es"

Be careful

To set email use the global variable user.email, not user.mail

Trust me, many people miss this.

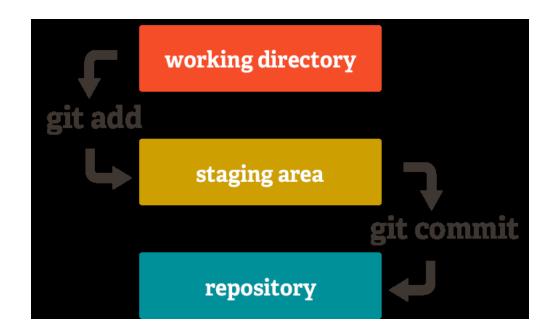

How to edit settings

To unset some setting, use git config --global --unset setting.name

Working Local

git init

Initializes a new repository in the current directory

Staging Workflow

Image credits: GIT's webpage

More info: http://git-scm.com/about/staging-area

git status

Gives you information about files staging in the working directory

git add filena.me

Stage filena.me. You can stage more than one files at the same time. You can also track all changes in the working directory using git add -A

git rm filena.me

File is no longer tracked

git commit -m "Message"

Makes commit, a snapshot of the current status of your project.

git log

Gives you information about commits

Let's try it!

Working Remote

Setting proxy

git config --global http.proxy http://proxy.alu.uma.es:3128
git config --global https.proxy http://proxy.alu.uma.es:3128

Unsetting proxy

We already told you!

git config --global --unset http.proxy
git config --global --unset https.proxy

git remote add name url

git remote add **origin http://github.com/user/repo/** Adds a new remote to your repository, named *origin*.

git remote -v

Gives you a list of the current remotes.

git pull remote branch

Synchronizes your local repository with the remote work.

git push remote branch

Synchronizes the remote repository with your local work.

git clone url

Clones the repository «url».

Using Github

Creating a new repository

Syncing my remote repository

Use case

Recommendations

SourceTree

SublimeGIT for Sublime Text

Questions?

Thank you!
